High-tech at Huber

Our products contribute considerably to worldwide improvement of the quality of waters by separating nutrients, pollutants and solids from the flow as they achieve optimum operational and economic efficiency.

There is a continuous change in what is technically feasible, particular in the field of environmental protection. Today's state-of-the-art technology may be obsolete tomorrow already. In view of such permanently changing requirements and problems of environmental protection it is especially important to be able to offer the right solution at the right time. The development of future-oriented technology which considers the requirements of municipalities and industry is therefore our primary task. Following that commitment we focus on new materials and new high-quality but low-cost products which require minimum maintenance to reduce operational costs.

Permanent research and development of new products, up-to-date equipment for optimal manufacture at favourable cost are indispensable prerequisites.
